Marriages—*October*, *November*, *December*, 1913.
Births and **Deaths**—*January*, *February*, *March*, 1914.

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

General Register Office, Somerset House
30th April, 1914.

ENGLAND AND WALES.

The figures in this Quarterly Return are based upon the BIRTHS and DEATHS registered in the 1,987 registration sub-districts of England and Wales in the three months ended 31st March, 1914; and the MARRIAGES in 15,958 churches or chapels, in 16,472 registered places of worship unconnected with the Established Church, and in 633 Superintendent Registrars' Offices, in the three months ended 31st December, 1913.

The births registered during the three months ended 31st March, 1914, numbered 217,187 and the deaths 146,186; the number of persons married during the three months ended 31st December, 1913, was 152,064.

Marriages.

The number of persons married during the *fourth* quarter of 1913 corresponds to an annual rate of 16·3 per 1000 of the population, which is estimated to amount to 36,919,339 persons at the middle of the year 1913; this is 0·3 per 1000 below the mean marriage-rate in the ten preceding fourth quarters, and 1·2 per 1000 below the rate recorded in the fourth quarter of 1912.

(33395—41.) Wt. 227—597. 875. 5/14 D & S. G 31. Sch. 5. A

Births.

The births registered in the *first* quarter of 1914 correspond to a rate of 23·6 annually per 1000 of the population, which is estimated to amount to 37,302,983 persons at the middle of this year; this is 2·8 per 1000 below the mean birth-rate in the ten preceding first quarters, and 0·2 per 1000 below the rate in the corresponding period of 1913.

Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 71,001, against 80,457, 77,947, and 69,984 in the first quarters of 1911, 1912, and 1913, respectively.

Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 15·9 per 1000 persons living; this rate is 1·2 per 1000 below the mean rate in the ten preceding first quarters, and 0·2 below the rate recorded in the corresponding period of 1913.

The 146,186 registered deaths included 74,809 of males and 71,377 of females, the death-rate among males being 16·8, and that among females 15·0, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding first quarters, the death-rate of males showed a decrease of 1·1, and that of females a decrease of 1·3. Out of equal numbers living, the deaths of males were to those of females as 112 is to 100, the mean proportion in the first quarters of the ten preceding years being 110 to 100.

Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 115 per 1000, being 10 per 1000 below the average in the ten preceding first quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 8·5 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 101·6 per 1000 of the estimated population at this group of ages.

Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age-groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *first* quarter of 1914, compared with the corresponding average rates in the *first* quarters of the ten preceding years, and also with the rates last quarter in the 97 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from scarlet fever and diphtheria last quarter was equal to the average; that from measles was about half the average, and that from enteric fever and whooping-cough about two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 97 great towns last quarter were as follows :—from *enteric fever*, 0·17 in Sheffield, 0·19 in Devonport, 0·20 in Halifax, and 0·22 in Wigan and in Dewsbury ; from *measles*, 1·16 in West Bromwich, 1·55 in Dudley, 1·98 in Swansea, 2·90 in Barnsley and 3·57 in Burnley ; from *scarlet fever*, 0·41 in Stockton on Tees, 0·43 in South Shields, 0·44 in Preston and in Middlesbrough, and 0·55 in Salford ; from *whooping cough*, 0·89 in Rochdale, 0·96 in Sheffield, 1·08 in Dudley and 1·55 in Swansea ; and from *diphtheria*, 0·54 in Darlington, 0·70 in Northampton and 0·83 in Cambridge. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 16·42 in Stoke on Trent, 19·25 in Swansea, 19·43 in Burnley and 19·85 in Middlesbrough.

UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1914 is estimated at 46,407,737 persons ; that of England and Wales at 37,302,983, that of Scotland at 4,729,200, and that of Ireland at 4,375,554.

In the United Kingdom 273,581 *births* and 187,306 *deaths* were registered in the three months ended 31st March, 1914. The natural increase of population was, therefore, 86,275. The number of *persons married* in the United Kingdom during the quarter ended 31st December, 1913, was 179,648.

The birth-rate in the United Kingdom in the *first* quarter of 1914 was 23·9, and the death-rate 16·4, per 1000 of the estimated population. The marriage-rate in the *fourth* quarter of 1913 was 15·5 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 31st March, 1914, the departures of passengers stated to be of British nationality exceeded the arrivals by 27,561 persons, a decrease of 59 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 1,869, the balance in the corresponding period of the previous year having been 19,926.

The passenger movement between the United Kingdom and the Continent of Europe showed a balance inward of 10,771 persons, British and aliens, in the first quarter of the year. The excess of aliens arriving from the Continent over those departing for the Continent in the first quarter was 8,280 against 26,394 in the corresponding quarter of 1913.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 18,659 outward.

COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of 25 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 4th April, 1914 (Table XV.).

RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 4th April, 1914 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

Meteorology.

The weather of the quarter as a whole was very mild, the only notable cold period being a fortnight in January, while the total rainfall was considerably in excess of the average, in spite of a dry January, and the duration of bright sunshine below the normal. The only really severe frosts were recorded in January, either on the 1st, 23rd, or 24th, and subsequently the temperature was almost continuously above the normal both during the day and night. Rain fell with unusual frequency in most parts of the country during February and March, but over a considerable portion of the midlands and eastern and north-eastern England the total fall in the former month was less than the average. Downpours exceeding an inch within 24 hours were rather common in the western and south-western districts. From the third week in January until the end of the quarter the flow of air over the country was almost constantly from some point of the compass between South and West, and gales and high or strong winds occurred very frequently. Sea fogs were experienced at times on the coast, especially in the west and south-west, but there was very little fog inland.

January brought little intense frost and little snow, although between the 11th and 24th the weather was continuously cold. During this period there was a stream of air drawn over these Islands from the East and North-East, and while the thermometer seldom rose as high as 40° during the day, except on the western coasts, it rarely fell much below freezing point at night. In the south-east of England, where the cold was the most pronounced, it occasionally remained at about 32° throughout the day. The cold spell was accompanied by much cloud, and it was not until a fall of the barometer in the west heralded the return of the wind to the South-ward, that the sky cleared in the metropolitan area. On the 23rd, with an overcast sky, the maximum temperature at Kew was as low as 31°, but at night when the clouds dispersed, it descended to 19°. Similar minima were recorded over a considerable portion of England. The remaining week, like most of the days before the 10th, was very mild, and as a whole the temperature of the month differed little from the average. In the northern counties it was slightly above the normal value, and over the southern half of the country between 1° and 2° below it. The Southerly to Westerly winds of the first and last weeks brought frequent rain, and also some hail and sleet, but heavy falls were not common, and the total rainfall for the month was much less than the average. Over a large portion of England it was only about 50 per cent. of the normal, and at several places in the south less than 30 per cent. At Totland Bay the total was no more than 15 per cent. Some parts of East Anglia formed an

exception to the rule; at Great Yarmouth the percentage was as high as 145. Bright sunshine was, with few exceptions, very deficient.

February was mild, wet, and windy, while the sunshine varied greatly, being much above the normal in the south-east and east of England and below it in most other parts of the country. The greatest excess was at Westminster, where there was a mean of 2·7 hr. per day, against an average no higher than 1·2 hr. daily. With the wind almost constantly from South or South-West, and often blowing very strongly or with the force of a gale, the mean temperature was unusually high for the time of year. Over the major portion of the country the mean was about 5° in excess of the normal. The first fortnight was, however, appreciably milder than the subsequent two weeks, and during that period maximum readings of 50° and above were recorded day after day over a very large area. At Camden Square, London, 50° was reached or exceeded every day from the 29th January to February 15th, forming a record for the time of year. Frost was consequently very rare, but occasionally during the interval between the departure and advent of a cyclonic disturbance the thermometer fell to a few degrees below freezing point. While the country generally had much more rain than usual, and some flooding occurred in the Thames Valley, parts of central and north-eastern England were relatively dry. At Hull the total rainfall was only 43 per cent. of the average, and at Bawtry 54 per cent.; but at Salisbury it was as high as 248 per cent. Much of the rain fell after sunset and before sunrise. At Bramhall, near Stockport, the total fall for the month during the 11 hours ending at 8 a.m. daily yielded 1·55 in., but the falls during the 13 hours ending at 9 p.m. daily gave a total of only 0·34 in.

March began with a very mild week, the temperature ranging from 4° to nearly 6° above the normal, and the following week showed an excess of about 2° on the normal temperature. The remainder of the month was, however, rather cold for the time of year, until the 31st, when the thermometer marked readings of 60° or a few degrees higher over a large portion of the country. Frosty nights were seldom experienced, the sharpest occurring on the 10th, 11th, 12th, or during the last week. In several isolated places the minima were as low as 24° or 25°, but generally the values varied between 26° and 30°. As a whole the temperature of the month was between 1° and 2° above the normal. The chief feature of the period was its rain. In several localities over the southern half of England there was more rain than ever recorded in March previously. In the south-west rain fell on 27 days, and in England N.E., the driest district, there were 21 days with rain. The excess on the normal was extremely large generally, but there were some exceptions in the north-east of England. At Rounton the fall was only 70 per cent. of the average, while over a large portion of the country it varied between 150 and 200 per cent., at Dungeness it equalled 341 per cent., and at Shoeburyness 365 per cent. Bright days were very few, and the total number of hours of sunshine showed a marked deficit. In the Midland Counties the daily mean was only 2·6 hr., nearly an hour per day less than the normal, and in the Channel Islands and at Scilly the deficit amounted to nearly 1·5 hr. per day.

During the quarter as a whole the *mean temperature* was more than 2° above the average except in the English Channel district,

where the excess was less than 1°. Over the western and southern districts the mean temperature exceeded 42°, and in the midlands, east, and north-east of England it was about 41·5°. During the warm weather of the first week of March the thermometer rose to 55° or above in the southern half of England, the highest value recorded being 59° at Southampton on the 6th, and in the following week readings as high as 58° were reported locally in the south-east and south. On the 31st a few stations in the east and south had maximum readings of 65° or 66°.

The *rainfall* of the period exceeded the normal very generally. The north-east of England, however, formed an exception, the percentage of the average being no more than 93, and in the midland counties the excess was slight, the percentage amounting to only 103. In England E. and also in the South-West it was about 139 per cent., and in England South-East as high as 154 per cent. The actual fall ranged from 4·7 in. in England North-East to 9·4 in. in England South-East, to 10·8 in. in the English Channel, and to 12·8 in. in England South-West. Rain days were fewer in the midland counties than elsewhere, the total being 51, while in England South-West rain fell on 60 days, and in the English Channel on 63 days.

Bright Sunshine was below the normal everywhere, but in England East and South-East the deficiency was slight. In the former district the daily mean of 2·7 hours was 97 per cent. of the average, and in the latter, where the daily mean was also 2·7 hours, the percentage of the average was 95. In the midland counties the daily mean was only two hours, or 80 per cent. of the normal, and in England South-West the correspondiug values were 2·2 hours and 78 per cent.

TABLES.

* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex and age constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix.

* The Price of Consols and the Rate of Discount are furnished by the Chief Cashier of the Bank of England.
† As published by the Board of Agriculture.
‡ Furnished by the Board of Agriculture.
§ Furnished by the Mining Statistics Branch of the Home Office. The prices relate to Sunderland coal only.
¶ No quotations during the quarter.

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 31st December, 1913; BIRTHS and DEATHS registered in the Quarter ended 31st March, 1914.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 6259). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

REGISTRATION COUNTIES.	ESTIMATED POPULATION in the middle of 1914 *	MARRIAGES in Quarter ended 31st Dec., 1913.	BIRTHS in Quarter ended 31st Mar., 1914.	DEATHS in Quarter ended 31st Mar., 1914.	The DEATHS registered include													REGISTRATION COUNTIES.

TABLE VII.—**97 Great Towns; Greater London; 4 Scottish** or **Irish Towns.—Population; Births, Deaths,** and **Meteorology** in the 13 Weeks ended **4th April, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. The number of towns is now increased by the inclusion of the City of Exeter.

TOWNS.	ESTIMATED POPULATION in the middle of 1914.*	BIRTHS.	DEATHS.	The DEATHS registered include: Deaths of		Deaths from								Inquest Cases.	Deaths in Public Institutions.	Uncertified Causes of Death.	MEAN TEMPERATURE (Degrees Fahr.). †	RAINFALL (Inches). †	TOWNS.

* The values for Mean Temperature and Rainfall relate to the calendar quarter.

[a] Phœnix Park.

[b] Fitzwilliam Square.

† The figures for Edinburgh and Glasgow relate to the calendar quarter. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents registered elsewhere in Scotland.

‡ Excluding deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively.

§ As extended on 9th November 1913.

¶ Including Croup.

TABLE VIII.—**97 Great Towns; Greater London; 4 Scottish** or **Irish Towns.—Birth-rate, Death-rate,** and **Analysis** of **Mortality** in the 13 Weeks ended **4th April, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. The number of towns is now increased by the inclusion of the City of Exeter.

† Uncorrected for deaths of non-residents.

‡ Including croup.

TABLE 12.—**One hundred and forty-five Smaller Towns.—Population; Births and Deaths in the QUARTER ended 31st March, 1914.**

NOTE.—The 145 Smaller Towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. In consequence of extension in 1913 the City of Exeter is now transferred to the group of Great Towns and the City of St. Albans is added to the group of Smaller Towns.

TOWNS.	ESTIMATED POPULATION IN THE MIDDLE OF 1914.*	BIRTHS.	DEATHS.	The DEATHS registered in the Quarter include													TOWNS.
				Deaths of		DEATHS from											
				Infants under 1 Year of Age.	Persons aged 65 Years and upwards.	Enteric Fever.	Small-pox.	Measles.	Scarlet Fever.	Whooping cough.	Diphtheria.	Diarrhœa and Enteritis (under 2 years).	Violence. * This table is supplied by the Medical Officer of Health of the Administrative County of London, and is compiled from returns which the London County Council receives from the Metropolitan Asylums Board under section 55 (4) of the Public Health (London) Act, 1891.

† Based on the results of the Censuses of 1901 and 1911.

‡ These cases were subsequently found not to be small-pox.

TABLE XII.—PROPORTION to POPULATION of CASES of INFECTIOUS DISEASE NOTIFIED in certain LARGE TOWNS of ENGLAND and WALES during the 13 Weeks ended 4th April, 1914.

QUARTERLY RETURN

OF

MARRIAGES, BIRTHS, AND DEATHS

REGISTERED IN

ENGLAND AND WALES,

AND IN THE REGISTRATION COUNTIES;

AND OF BIRTHS, DEATHS, AND NOTIFIED CASES OF INFECTIOUS DISEASE IN CERTAIN LARGE TOWNS.

Published by Authority of the Registrar-General.

Printed under the Superintendence of His Majesty's Stationery Office,

AND SOLD BY WYMAN AND SONS, LTD., FETTER LANE, E.C.

No. 262.] [Price 9*d.*

Marriages—*January*, *February*, *March*, 1914.
Births and **Deaths**—*April*, *May*, *June*, 1914.

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

General Register Office, Somerset House,
31*st July*, 1914.

ENGLAND AND WALES.

The figures in this Quarterly Return are based upon the BIRTHS and DEATHS registered in the 1,984 registration sub-districts of England and Wales in the three months ended 30th June, 1914; and the MARRIAGES in 15,969 churches or chapels, in 16,522 registered places of worship unconnected with the Established Church, and in 633 Superintendent Registrars' Offices, in the three months ended 31st March, 1914.

The births registered during the three months ended 30th June, 1914, numbered 226,013 and the deaths 124,134; the number of persons married during the three months ended 31st March, 1914, was 102,032.

Marriages.

The number of persons married during the *first* quarter of 1914 corresponds to an annual rate of 11·1 per 1000 of the population, which is estimated to amount to 37,302,983 persons at the middle of this year; this is 0·1 per 1000 below the mean marriage-rate in the ten preceding first quarters, and 2·3 per 1000 below the rate recorded in the first quarter of 1913.

Births.

The births registered in the *second* quarter of 1914 correspond to a rate of 24·3 annually per 1000 of the population ; this is 2·3 per 1000 below the mean birth-rate in the ten preceding second quarters, and 0·4 per 1000 below the rate in the corresponding period of 1913.

Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 101,879, against 105,808, 102,293, and 105,620 in the second quarters of 1911, 1912, and 1913, respectively.

Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 13·3 per 1000 persons living ; this rate is 0·6 per 1000 below the mean rate in the ten preceding second quarters, but 0·1 above the rate recorded in the corresponding period of 1913.

The 124,134 registered deaths included 64,498 of males and 59,636 of females, the death-rate among males being 14·3, and that among females 12·4, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding second quarters, the death-rate of males showed a decrease of 0·6, and that of females a decrease of 0·5. Out of equal numbers living, the deaths of males were to those of females as 115 is to 100, the mean proportion in the second quarters of the ten preceding years being the same.

Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 88 per 1000, being 10 per 1000 below the average in the ten preceding second quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 7·6 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 79·8 per 1000 of the estimated population at this group of ages.

Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age-groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *second* quarter of 1914, compared with the corresponding average rates in the *second* quarters of the ten preceding years, and also with the rates last quarter in the 97 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from whooping cough and diphtheria last quarter was approximately equal to the average ; that from scarlet fever was slightly below the average, and that from enteric fever and measles about two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 97 great towns last quarter were as follows :—from *enteric fever*, 0·14 in Devonport, 0·15 in Grimsby and in Nottingham, 0·21 in Rochdale, and 0·30 in Wakefield ; from *measles*, 1·23 in Warrington, 1·39 in Dudley, 1·42 in Stockton on Tees, 1·45 in Sheffield, and 1·49 in Rochdale ; from *scarlet fever*, 0·23 in West Bromwich, 0·25 in Manchester, 0·29 in Middlesbrough, 0·38 in Salford, and 0·40 in Oldham ; from *whooping cough*, 0·85 in Walsall, 0·86 in Sheffield, 0·89 in Middlesbrough, 1·05 in Swansea, and 1·12 in South Shields ; and from *diphtheria*, 0·28 in Great Yarmouth, 0·29 in York, and 0·30 in Stoke on Trent and in Bolton. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 14·27 in Burnley, 14·91 in Birkenhead, 20·65 in Dewsbury, 22·13 in Smethwick, and 23·04 in Middlesbrough.

UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1914 is estimated at 46,412,815 persons; that of England and Wales at 37,302,983, that of Scotland at 4,728,500, and that of Ireland at 4,381,332.

In the United Kingdom 285,127 *births* and 160,784 *deaths* were registered in the three months ended 30th June, 1914. The natural increase of population was, therefore, 124,343. The number of *persons married* in the United Kingdom during the quarter ended 31st March, 1914, was 133,132.

The birth-rate in the United Kingdom in the *second* quarter of 1914 was 24·6, and the death-rate 13·9, per 1000 of the estimated population. The marriage-rate in the *first* quarter of 1914 was 11·6 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 30th June, 1914, the departures of passengers stated to be of British nationality exceeded the arrivals by 7,030 persons, a decrease of 92 per cent. as compared with the corresponding period of the previous year. Of aliens those arriving exceeded those leaving by 13,566, the balance in the corresponding period of the previous year having been 26,168 outward.

The passenger movement between the United Kingdom and the Continent of Europe or the Mediterranean Sea showed a balance inward of 35,195 persons, British and aliens, in the second quarter of the year. The excess of aliens arriving from the Continent or the Mediterranean Sea over those departing for the Continent or the Mediterranean Sea in the second quarter was 15,887 against 56,379 in the corresponding quarter of 1913.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 41,731 inward.

COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of 26 of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 4th July, 1914 (Table XV.).

RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 4th July, 1914 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

Meteorology.

The spring quarter, like the preceding quarter, was decidedly mild, the mean temperature ranging from 1° to 2° above the normal. During the corresponding period of last year the mean temperature differed little from the normal. The highest temperature for the quarter was not experienced until the end of June, when the thermometer rose to between 85° and 90° in several localities. In May the thermometer ascended to about 80° in the south-east and south on the 22nd, but after some severe thunderstorms a very abrupt reduction of temperature occurred, and during the cold spell that followed sharp night frosts were experienced in many districts.

The *Rainfall* was unusually slight over the whole country. Over an extensive area in the southern and south-western districts the general condition was more or less droughty. In England East, South-East, and South-West the aggregate fall was less than 70 per cent. of the average; in the Midland Counties 77 per cent., and in England South-West 84 per cent. In England North-East, in spite of some heavy rains in June, the percentage was no more than 91. In England South-East there were only 28 days with a measurable quantity of rain. Last year the amount of rain during the corresponding quarter was below the normal in England East and just equal to it in England South-East, but in all other districts it was considerably in excess.

Bright Sunshine exceeded the normal throughout the country. In England South-East, the brightest district, the mean daily amount was 7·9 hours, and in England East, South-West, and the Channel Isles, it was more than seven hours. In England North-West, where the mean daily number of hours was no more than 6·5, the percentage of the average was 108, while in England East and the Midlands the percentage equalled 120, and in England South-East it was as high as 122. Last year the figures for the corresponding quarter were all below the normal, and over the country generally there was about 1½ hours per day less than during the quarter under review.

April gave but few cold days, and as a whole the month was *mild, dry, and bright.* The warmest part of the period occurred for some days after the 19th, when the temperature was many degrees above the normal—more than 6° over the greater portion of the country. For the month as a whole the temperature ranged from 3° above the average in England South-East to 4°·6 in the north-eastern counties. The warmth was to a large extent due to a flow of air drawn from the South-Westward, and to the relative absence of cloud and the consequent great number of bright days. Night frost occurred from time to time, but little damage was done

to fruit blossom and other vegetation, except locally over the inland districts. The clear sky of the latter half of the month was favourable both for a high day and a low night temperature, and the diurnal range was very large. Maximum readings of about 70° were sometimes followed by minima of 32° or a little lower at many places away from the coast.

No cyclonic centres travelled directly across the Kingdom, but some came near enough to produce gales or strong winds from between South and West. These disturbances, with their accompanying rain, all arrived before the 12th, and as the type of weather following was mainly anticyclonic the conditions became very dry. Over the southern half of the country there was practically no rain from the 12th until the end of the month. The south-west of England was, contrary to the rule, as dry as the south-east. At Penzance there was no rain for 19 days, and at Ashburton and Scilly for 20 days. Over England and Wales generally the rainfall was only 62 per cent. of the normal. In the north-eastern counties the percentage was below 40—only 22 at Hull and 18 at Durham. The month was as remarkable for its sunshine as for its high temperature and deficient rainfall. Over nearly the whole of England and Wales the total number of hours recorded exceeded 200, or more than $6\frac{1}{2}$ hours per day, while in numerous localities the figure was about 240 hours. The greatest excess on the average occurred at Westminster, where the daily mean was nearly seven hours, and the aggregate 216 against an average of 113 hours. The south-west of England and South Wales were the most sunny regions of all, the mean daily record being $8\frac{1}{2}$ hours over a wide area.

May, relatively to its average, and also actually, was much *less sunny* than April, although like that month, it was *dry*. Except in England East and South-East, the total duration of bright sunshine was deficient. In the northern counties the deficit exceeded an hour per day, and in the midlands it was about $\frac{3}{4}$-hour, whereas in most parts of the east and south-east the excess over the average was slight. The brightest part of the country was the south-east coast of Kent, while the lowest records were reported from Hull, Manchester, and some other northern industrial centres. In the former region the mean daily amount was more than eight hours, while in the latter it was less than four hours. Westminster again had a comparatively large excess—nearly $\frac{3}{4}$-hour per day. Excepting an excess of 1·1 per day at Margate, this was the largest positive divergence from the normal.

In a few localities the total rainfall exceeded the average, but generally it was below it, and a considerable portion of the month, after the 12th, was droughty, almost the only rain falling about the 22nd, with a good deal of thunder and lightning. At Haverfordwest there was no rain from the 12th to the 28th. In many districts the aggregate fall was below 60 per cent. of the average, the lowest figure being 44 per cent. at St. Leonards.

The temperature underwent some great variations, but as a whole, did not differ much from the normal. The beginning of the month was rather warm, and the second week about normal, while the third—the only bright one—was very warm, and the last week very cold. The fourth week had a mean temperature about 8° lower than the third. Local frost at night was experienced on the 2nd, when some damage was done to tender vegetation in the midlands and north, and night frosts were rather widespread on the 10th. A few days later the thermometer rose very appreciably, and on the 15th and 16th reached a maximum of 70°. A little later, between the

18th and 22nd, the warmest period of the month occurred. At some stations in the east and south-east readings of 80° were registered on the 22nd. The heat was followed by thunderstorms over a large area, and a very sudden change to a much lower temperature was brought about by the setting in of a Northerly wind current. For a few days the maxima were no higher than the minima had been, and on the wind sinking to a light variable breeze or calm, on the 25th, 26th, and 27th, severe frosts doing great injury to vegetation in the inland and northern districts were experienced.

June was marked by some serious *electrical disturbances* accompanied by heavy local rains, but generally the month was *very bright and dry*, with a mean temperature not far from the normal. Thunderstorms occurred in many places on the 8th and 9th, and a large area in the midlands, east, and north-east had a large quantity of rain. Further thunderstorms were experienced on the afternoon or evening of the 14th over the southern districts of England, and in the south and south-west of the metropolis the visitation was extremely violent, while the consequences were serious. At Wandsworth Common seven persons met their death by lightning. The quantity of rain varied greatly from a mere sprinkle or none in the north of London, and a moderate shower at some places in the south to 2·4 in. at Wimbledon, 3·7 in. at Richmond Park, and more than 3·4 in. in the neighbourhood of Staines. During the course of the storm at Westbourne, Sussex, where 0·73 in. of rain fell within ten minutes, there was a remarkable decrease of temperature, the thermometer falling from 75° to 64° in five minutes. One of the chief features of the month was the little rain experienced in some of the southern counties. In parts of Hampshire, Dorset, and Wiltshire the aggregate fall was less than 0·5 in. At Wilton and Ventnor the total rainfall was only 16 per cent. of the normal, at Southampton 18 per cent., and at Southend-on-Sea 24 per cent. In the east and north-east of England, on the other hand, many places had an aggregate above the normal. At Durham, the percentage was as high as 229, at North Shields 174, Alnwick Castle 158, Rounton 171, and at Little Massingham 157. The latter half of the month was generally much warmer and brighter than the earlier days, and quite at the close, the temperature rose to a maximum above 80° over a large area. In some localities the figure of 85° was recorded, and in London on the 30th the thermometer touched 89°. Accompanying the high temperature there was much sunshine, and the total number of hours for the month was far above the normal. On the coast from Essex to Hampshire, and also at Cardiff, the sun's record exceeded nine hours per day, and over southern England generally it was more than eight hours per day. At a few places in the south-west, however, the conditions were more cloudy, the total number of hours at Woolacombe being only 89 per cent. of the average, whereas at several places in central England it was about 135 per cent., and at Westminster as high as 150 per cent.

TABLES.

TABLE I.—**Marriages, Births,** and **Deaths** registered in **England** and **Wales** in the Years **1904-1914,** and in each Quarter of those Years.

* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex and age constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix.

* The Price of Consols and the Rate of Discount are furnished by the Chief Cashier of the Bank of England.
† As published by the Board of Agriculture.
‡ Furnished by the Board of Agriculture.
§ Furnished by the Mining Statistics Branch of the Home Office. The prices relate to Sunderland coal only.
¶ No quotations during the quarter.

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 31st March, 1914; BIRTHS and DEATHS registered in the Quarter ended 30th June, 1914.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 6259). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

TABLE VII.—**97 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths,** and **Meteorology** in the 13 Weeks ended **4th July, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

* The values for Mean Temperature and Rainfall relate to the calendar quarter.

[a] Phœnix Park.

[b] Fitzwilliam Square.

† The figures for Edinburgh and Glasgow relate to the calendar quarter. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents registered elsewhere in Scotland.

‡ Excluding deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively

§ Including Croup.

TABLE VIII.—**97 Great Towns; Greater London; 4 Scottish** or **Irish Towns.—Birth-rate, Death-rate,** and **Analysis** of **Mortality** in the 13 Weeks ended **4th July, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

* Uncorrected for deaths of non-residents.

† Including croup.

TABLE IX.—**One hundred and forty-five Smaller Towns.—Population; Births** and **Deaths** in the QUARTER ended 30th June, 1914.

NOTE.—The 145 Smaller Towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	ESTIMATED POPULATION IN THE MIDDLE OF 1914.*	BIRTHS.	DEATHS.	The DEATHS registered in the Quarter include														TOWNS.
				Deaths of		DEATHS from											Deaths under 1 year to 1000 Births.

QUARTERLY RETURN

OF

MARRIAGES, BIRTHS, AND DEATHS

REGISTERED IN

ENGLAND AND WALES,

AND IN THE REGISTRATION COUNTIES;

AND OF BIRTHS, DEATHS, AND NOTIFIED CASES OF INFECTIOUS DISEASE IN CERTAIN LARGE TOWNS.

Published by Authority of the Registrar-General.

Printed under the Superintendence of His Majesty's Stationery Office,

AND SOLD BY WYMAN AND SONS, LTD., FETTER LANE, E.C.

No. 263.] [Price 9*d.*

Marriages—*April*, *May*, *June*, 1914.
Births and **Deaths**—*July*, *August*, *September*, 1914.

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report.

General Register Office, Somerset House,
31*st October*, 1914.

ENGLAND AND WALES.

The figures in this Quarterly Return are based upon the BIRTHS and DEATHS registered in the 1,982 registration sub-districts of England and Wales in the three months ended 30th September, 1914; and the MARRIAGES in 15,978 churches or chapels, in 16,581 registered places of worship unconnected with the Established Church, and in 633 Superintendent Registrars' Offices, in the three months ended 30th June, 1914.

The births registered during the three months ended 30th September, 1914, numbered 226,998 and the deaths 115,553; the number of persons married during the three months ended 30th June, 1914, was 162,192.

Marriages.

The number of persons married during the *second* quarter of 1914 corresponds to an annual rate of 17·4 per 1000 of the population, which is estimated to amount to 37,302,983 persons at the middle of this year; this is 1·2 per 1000 above the mean marriage-rate in the ten preceding second quarters, and 3·1 per 1000 above the rate recorded in the second quarter of 1913. This rate is the highest recorded in any second quarter since 1906.

(33475—41.) Wt. 227—597. 875. 11/14. D & S. G 31. Sch. 5.

Births.

The births registered in the *third* quarter of 1914 correspond to a rate of 24·1 annually per 1000 of the population ; this is 1·8 per 1000 below the mean birth-rate in the ten preceding third quarters, and 0·1 per 1000 below the rate in the corresponding period of 1913.

Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 111,445, against 81,557, 117,552, and 111,976 in the third quarters of 1911, 1912, and 1913, respectively.

Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 12·3 per 1000 persons living ; this rate is 0·9 per 1000 below the mean rate in the ten preceding third quarters, but 0·1 above the rate recorded in the corresponding period of 1913.

The 115,553 registered deaths included 60,554 of males and 54,999 of females, the death-rate among males being 13·3, and that among females 11·3, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding third quarters, the death-rate of males showed a decrease of 1·0, and that of females a decrease of 0·9. Out of equal numbers living, the deaths of males were to those of females as 117 is to 100, the mean proportion in the third quarters of the ten preceding years being 118.

Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 112 per 1000, being 22 per 1000 below the average in the ten preceding third quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 6·8 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 63·8 per 1000 of the estimated population at this group of ages.

Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age-groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *third* quarter of 1914, compared with the corresponding average rates in the *third* quarters of the ten preceding years, and also with the rates last quarter in the 97 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality from enteric fever last quarter was slightly more than half the average, and that from measles, scarlet fever, whooping cough and diphtheria slightly below the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 97 great towns last quarter were as follows :—from *enteric fever*, 0·18 in Wigan and in South Shields, 0·19 in Devonport and in York, 0·20 in Tynemouth, 0·21 in Hull, and 0·26 in Portsmouth ; from *measles*, 0·76 in Liverpool, 0·84 in Leeds, and 2·47 in Oldham ; from *scarlet fever*, 0·24 in Salford and in Preston, 0·25 in Rotherham, 0·30 in Carlisle, and 0·48 in Warrington ; from *whooping cough*, 0·47 in Ipswich and in Burnley, 0·48 in Warrington, and 0·67 in Barnsley ; and from *diphtheria*, 0·29 in

Gillingham, 0·33 in Leyton, 0·35 in Great Yarmouth, 0·45 in Stoke on Trent, and 0·54 in Middlesbrough. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 115·53 in Sunderland, 119·78 in Bootle, 120·00 in Bolton, and 130·25 in Wigan and in Gateshead. In accordance with precedent special tables relating to summer mortality from diarrhœa and enteritis have been inserted in the present Return (Tables XV. and XVI.).

UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1914 is estimated at 46,412,815 persons; that of England and Wales at 37,302,983, that of Scotland at 4,728,500, and that of Ireland at 4,381,332.

The number of *persons married* in the United Kingdom during the quarter ended 30th June, 1914, was 191,520, corresponding to an annual rate of 16·6 per 1000 of the estimated population.

The numbers of *births* and *deaths* in the United Kingdom in the three months ended 30th September, 1914, cannot be given yet, the figures relating to Scotland not being available at the time of going to Press.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 30th September, 1914, the departures of passengers stated to be of British nationality exceeded the arrivals by 27,314 persons, a decrease of 58 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 30,619, the balance in the corresponding period of the previous year having been 38,151.

The passenger movement between the United Kingdom and the Continent of Europe or the Mediterranean Sea showed a balance inward of 76,715 persons, British and aliens,* in the third quarter of the year.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 18,782 inward.

COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of some of the principal Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 3rd October, 1914 (Table XVII.).

RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 3rd October, 1914 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

---

* The figures distinguishing the number of aliens in this total during August and September, 1914, are not available.

Meteorology.*

The most salient features of the weather for the quarter were the long spells without rain in August and September. After July, which was generally unsettled and rainy, the normal condition became fine and bright, and rainy periods the exception. Severe thunderstorms were infrequent, although storms of moderate energy were experienced at times in various localities, and much of the total rainfall for the quarter occurred in heavy downpours connected with thunderstorms in July.

In spite of an occasional cool week and the absence of any considerable spell of abnormal heat, the mean temperature of the quarter was rather above the normal.

July.—The chief feature of the month was the unusual cloudiness of the sky. After the first nine or ten days the daily records of bright sunshine were almost continuously below the normal, and the mean deficit for the month exceeded an hour per day in England North-East, the Midland Counties, and England South-West, while in all the other districts it exceeded half-an-hour. Throughout the month the weather was very unstable, and it was only from the 9th to 11th that dry, settled weather prevailed over the whole of the United Kingdom. With this exception rain fell in some parts of the country daily, sometimes in large quantities and accompanied by thunder and lightning. Early in the month, when electrical disturbances were rather common, more than an inch of rain fell within twenty-four hours in many localities; at Bradford on the 1st the gauge yielded 2 in., and on the 2nd a similar total was recorded at Shrewsbury, while at Clifton (Bristol) on the former day as much as 1·1 in. fell in about 20 minutes. Some further heavy falls occurred in various parts of the country after the 14th, the most notable being 2·5 in. at Whitby on the 16th, and about 2 in. at Minehead, Ashburton, and Sidmouth on the 19th. On the 22nd during a thunderstorm at Margate 1·8 in. of rain fell in an hour The frequency of the rain varied from 20 days in the south-western counties to 17 in the north-west and the Midlands, and to 14 in the north-east. In England East heavy falls were rare, and the total for the month was less than the average. In all other districts, however, there was a substantial excess.

In spite of the relatively little sunshine the temperature was above the normal until the last week, when a sudden shift of wind to north-west and north brought it down many degrees. The mean for the month was, nevertheless, above the average except in England South-East and South-West, the greatest excess being 1·5° in England East. The highest temperature occurred on the 1st, when a maximum above 85° was registered over a large area, and readings of 90° were not uncommon over the inland districts of the south. Other brief outbursts of heat were experienced on the 13th and 14th and on the 20th and 21st, but about a week later the maxima were abnormally low for the time of year, the thermometer failing to reach 60° at some places in the Midlands and North.

August.—A few rainy periods were experienced, principally between the 1st and the 8th, and the 21st and 26th, but as a whole the weather was dry, bright, and warm, while the thunderstorms which occurred occasionally over a wide area, were seldom severe.

Until the 8th the temperature was some degrees below the normal, the main wind direction South or South-West, the sky cloudy or

* Furnished by the Director of the Meteorological Office.

overcast, and the general condition rainy and unsettled, with isolated thunderstorms. The rain was often copious and sometimes heavy, more than an inch falling within 24 hours in various localities. Among the largest measurements were 1·2 in. at Manchester and Buxton, and 1·6 in. at Shrewsbury on the 1st; 1·3 in. at Creech Grange, Dorset, on the 4th, and 1·4 in. at Lancaster and 1·5 in. at Aspatria on the 8th. Locally at Peny-y-Gwryd, Carnarvonshire, the fall on the 8th amounted to 6·4 in. During this time the maximum temperature, owing chiefly to the lack of sunshine, seldom exceeded 70° in the warmest parts of the Kingdom, and most of the nights were cooler than those later in the month.

The subsequent change to a drier and warmer condition continued over the greater part of the country until the 20th, but the most western and south-western districts were visited by thunderstorms on the 14th or 15th, and a few places recorded rain. At Guernsey during a thunderstorm on the 14th as much as 1·5 in. of rain fell in 15 minutes. With the brighter weather temperature rose gradually until readings above 70° became common, and by the 13th or 14th the maximum heat of the month was recorded. At Llandudno and Manchester the thermometer rose to 85°, and at Holyhead and Brighton to 86°. This, the longest dry spell of the month, was succeeded by a rather general thunderstorm on the 21st, and on several days a slight or moderate quantity of rain fell in nearly all parts of the country, while the temperature became appreciably lower both during the day and night, although it remained above the normal. The few days from the 24th till the 26th were somewhat thundery, and on the 25th various parts of the country experienced considerable or heavy falls of rain. From the 27th onward the weather was very quiet and mostly dry, with a rather high temperature.

For the month generally the temperature was about 1·5° above the average in the Midland Counties, England South-East, and England South-West, and rather more than 2° above in the other districts. The total rainfall was slightly above the average in England South-West, but in all other parts of the country there was a deficit, ranging from about 0·65 in. in England South and the Midland Counties to 1·4 in. in England North-West. Bright Sunshine exceeded the average everywhere. In England North-West the excess was about $1\frac{3}{4}$ hour per day, and in England East and the Midland Counties less than $\frac{1}{2}$ hour per day.

September.—The general character of the weather was anticyclonic and dry until the 7th or 8th, then cyclonic, with the wind between South and West and more or less rain, until about the 19th, and finally anticyclonic and very dry again. The temperature was some degrees above the normal during the first fortnight and subsequently below it. Bright sunshine was very prevalent, especially during the first and last weeks.

The only period of generally unsettled weather was between the 8th and 19th, the rest of the month being practically rainless and usually bright. The unsettled period began with local thunderstorms and rain in Cornwall and Devon before the 8th, but on that date thunderstorms were experienced over a large portion of the Kingdom. The accompanying rainfall was, however, slight or moderate except at a few places in the extreme south-west. At Fowey there was 1·2 in., and at Penzance 1·5 in. Thunderstorms were again very common on the 9th, and occurred locally on the 11th and 12th. On the 17th they broke over a large area, and on the 20th were again experienced sporadically. The storms were not of a very serious

nature, and the rainfall was rarely excessive. There were, nevertheless, a few notable exceptions. At Sidmouth on the 9th, with an Easterly wind, the rainfall amounted to 2·2 in., and on the same day 1·6 in. fell at Kirkby Lonsdale, 1·3 in. at Stonyhurst and Torquay, and about 1·0 in. in several other parts of the country. On the 16th, although there were no thunderstorms, heavy rain occurred in many districts. Numerous places had more than 1·0 in. At St. Annes-on-the-Sea there was 2·2 in., and at other places in Lancashire a fall of 1·3 in. was common, while in Snowdonia the figure was larger (2·8 in. at Bungalow and 3·3 in. at Pen-y-Gwryd). During this rainy period the main flow of air over the British Isles was from some point between South and West, or North-West, and there were several occasions when the wind rose to a very strong breeze or to a gale, especially on the 14th and 17th. In these instances a gale was experienced over a large portion of the country.

After the 20th the weather was mostly very dry and quiet, but on the 27th and 28th a strong West to North-West wind sprang up, and in various exposed places—generally in the northern districts—it attained the force of a gale.

Over England as a whole there was no measurable quantity of rain until the 8th, and none after the 20th until some time towards mid-October. In a few localities the drought was continuous after September 16th and at several places after the 17th. In some districts the result of the slight rainfall was very noticeable. The meteorological observer at Oundle made the comment—"A very dry, sunny month; springs and brooks very low," and the observer at Temple Bruer "Drought and gales very serious for agriculture."

The Quarter.—The mean temperature of the quarter was above the normal in all parts of the country, the excess ranging from 0·6° in the south-east and south-west to more than 1° in the north-west, east, and north-east. The warmest districts were the south-east and east, with a mean temperature of about 60·3, nearly 2° higher than in the north-east and north-west, the coolest regions. The highest temperature of the whole quarter was recorded on July 1st, when the thermometer ascended to 90° or a little higher at several places in the south, and to 85° or above, over a much larger area. Another brief outburst of heat occurred just before the middle of August, maximum readings between 80° and 86° being registered in various parts af the country.

Rainfall was less than the normal over the country generally, especially in the eastern counties, where the percentage of the average was only 67. In the north-west, however, the percentage was 101, and in the south-west 118. Except in the east and south-east the rainfall exceeded that of the corresponding quarter of last year, but the excess was very trifling in the eastern counties. Over the eastern half of the country the number of days with a measurable quantity of rain was 35 or 36, but the figure increased to 42 in the north-west and to 46 in the south-west.

Bright sunshine was more prevalent than in the two years preceding, but considerably less than in the bright third quarter of 1911. In all parts of the country the total number of hours exceeded the average. The brightest district was the south-east with a mean of 6·9 hours per day, followed by the east with 6·2 hours and by the south-west with 6·1 hours, while the least sunny was the midland counties with 5·6 hours per day.

TABLE VII.—**97 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology** in the 13 Weeks ended **3rd October, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TABLE VIII.—**97 Great Towns; Greater London; 4 Scottish or Irish Towns.—Birth-rate, Death-rate, and Analysis of Mortality in the 13 Weeks ended 3rd October, 1914.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

* The figures relating to Edinburgh and Glasgow for last quarter were not available at the time of going to Press.

† Uncorrected for deaths of non-residents.

TABLE IX.—**One hundred and forty-five Smaller Towns.—Population; Births** and **Deaths** in the QUARTER ended 30th September, 1914.

NOTE.—The 145 Smaller Towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

QUARTERLY RETURN & ANNUAL SUMMARY

OF

MARRIAGES, BIRTHS, AND DEATHS

REGISTERED IN

ENGLAND AND WALES,

AND IN THE REGISTRATION COUNTIES;

AND OF BIRTHS, DEATHS, AND NOTIFIED CASES OF INFECTIOUS DISEASE IN CERTAIN LARGE TOWNS.

Published by Authority of the Registrar-General.

Printed under the Superintendence of His Majesty's Stationery Office,

AND SOLD BY WYMAN AND SONS, LTD., FETTER LANE, E.C.

No. 264.] [Price 1*s*.

Marriages—*July*, *August*, *September*, 1914 *& Year* 1914.

Births and **Deaths**—*October*, *November*, *December*, 1914, *& Year* 1914.

NOTE.—The figures in this publication are tabulated mainly from statistical Returns furnished by the local Registrars, and may not be found to correspond exactly with the authoritative figures for the whole year to be published later in the Annual Report. *With this issue of the Quarterly Return tables relating to the year are incorporated. These tables also show revised estimates of population in the middle of* 1914 *which will be adopted in the Annual Report.*

General Register Office, Somerset House,
13th February, 1915.

QUARTERLY RETURN.

ENGLAND AND WALES.

The figures in this Quarterly Return are based upon the BIRTHS and DEATHS registered in the 1,977 registration sub-districts of England and Wales in the three months ended 31st December, 1914; and the MARRIAGES in 15,988 churches or chapels, in 16,614 registered places of worship unconnected with the Established Church, and in 633 Superintendent Registrars' Offices, in the three months ended 30th September, 1914.

The births registered during the three months ended 31st December, 1914, numbered 208,276 and the deaths 130,882; the number of persons married during the three months ended 30th September, 1914, was 164,048.

Marriages.

The number of persons married during the *third* quarter of 1914 corresponds to an annual rate of 17·4 per 1000 of the population, which is estimated to amount to 37,302,983* persons at the middle of the year 1914; this is 0·1 per 1000 above the mean marriage-rate in the ten preceding third quarters, but 0·6 per 1000 below the rate recorded in the third quarter of 1913.

* The revised estimate is 36,960,684 (see page vii).

(33513—41.) Wt. 227—597. 875. 3/15. D & S. G 31. Sch. 5.

Births.

The births registered in the *fourth* quarter of 1914 correspond to a rate of 22·2 annually per 1000 of the population, which is 2·4 per 1000 below the mean birth-rate in the ten preceding fourth quarters, and 0·6 per 1000 below the rate in the corresponding period of 1913

Natural Increase of Population.

The natural increase of population in England and Wales last quarter by excess of births over deaths was 77,394, against 85,506, 87,995, and 88,874 in the fourth quarters of 1911, 1912, and 1913, respectively.

Deaths.

The deaths registered in England and Wales last quarter correspond to an annual rate of 13·9 per 1000 persons living ; this rate is 0·6 per 1000 below the mean rate in the ten preceding fourth quarters, but 0·7 above the rate recorded in the corresponding period of 1913.

The 130,882 registered deaths included 67,678 of males and 63,204 of females, the death-rate among males being 14·9, and that among females 13·0, per 1000 of the estimated populations of the respective sexes. Compared with the average for each sex in the ten preceding fourth quarters, the death-rate of males showed a decrease of 0·5, and that of females a decrease of 0·7. Out of equal numbers living, the deaths of males were to those of females as 114 is to 100, the mean proportion in the fourth quarters of the ten preceding years being 112 to 100.

Mortality at Different Ages.

Infantile mortality, measured by the proportion of deaths under one year of age to registered births, was equal to 105 per 1000, being 17 per 1000 below the average in the ten preceding fourth quarters.

The mortality among persons aged between one year and sixty-five years was at the annual rate of 7·9 per 1000 of the estimated population at this group of ages.

Among persons aged sixty-five years and upwards the mortality was at the annual rate of 82·3 per 1000 of the estimated population at this group of ages.

Urban and Rural Mortality.

Table III. shows the birth-rates, the death-rates from all causes, from the principal epidemic diseases and from violence, and the death-rates at certain age-groups, together with the proportion of inquest cases, of uncertified deaths, and of deaths in public institutions in England and Wales during the *fourth* quarter of 1914, compared with the corresponding average rates in the *fourth* quarters of the ten preceding years, and also with the rates last quarter in the 97 great towns, in the 145 smaller towns, and in the remainder of England and Wales.

In the country as a whole the mortality last quarter from measles and diphtheria was slightly above, and that from scarlet fever and whooping cough was slightly below the average, while that from enteric fever was only two-thirds of the average.

The highest death-rates per 1000 persons living from the several epidemic diseases among the 97 great towns last quarter were as follows :—from *enteric fever*, 0·20 in Halifax and in Darlington, 0·21 in Warrington, 0·22 in Wigan and in Hull, 0·26 in Tynemouth,

and 0·29 in South Shields; from *measles*, 1·54 in Birkenhead, 1·75 in Gateshead, 2·50 in Grimsby, 2·96 in Newcastle on Tyne, and 3·02 in Wigan; from *scarlet fever*, 0·26 in Manchester, 0·27 in Darlington, 0·35 in Oldham, 0·54 in Dudley and in Warrington, and 0·61 in Preston; from *whooping cough*, 0·44 in Bristol and in Newcastle on Tyne, 0·45 in Barnsley, 0·46 in Tynemouth, 0·47 in Stockton on Tees, 0·57 in Merthyr Tydfil, and 0·58 in Rhondda; and from *diphtheria*, 0·48 in Tottenham, 0·49 in Southampton, 0·62 in Northampton, 0·69 in Wakefield, 0·73 in Middlesbrough, and 0·91 in Great Yarmouth. The highest death-rates per 1000 births from *diarrhœa and enteritis* among children under 2 years of age were 33·77 in Tynemouth, 33·90 in Blackburn, 35·05 in Liverpool, 38·99 in Oldham, 40·45 in Stockport, and 47·14 in Burnley.

UNITED KINGDOM.

The POPULATION of the UNITED KINGDOM in the middle of 1914 is estimated at 46,431,548 persons; that of England and Wales at 37,302,983, that of Scotland at 4,747,167, and that of Ireland at 4,381,398.*

In the United Kingdom 281,795 *births* and 146,980 *deaths* were registered in the three months ended 30th September, 1914. The natural increase of population was, therefore, 134,815. The number of *persons married* in the United Kingdom during the quarter was 193,996.

The birth rate in the United Kingdom in the *third* quarter of 1914 was 24·1, and the death-rate 12·6, per 1,000 of the estimated population. The marriage-rate in the same quarter was 16·6 per 1000.

For facts, in detail, concerning Scotland and Ireland reference should be made to the Quarterly Returns of the Registrars-General of those parts of the United Kingdom.

Passenger Movement.

According to a Return issued by the Board of Trade it appears that with respect to the passenger movement between the United Kingdom and places out of Europe in the three months ended 31st December, 1914, the departures of passengers stated to be of British nationality exceeded the arrivals by 1,605 persons, a decrease of 92 per cent. as compared with the corresponding period of the previous year. Of aliens those leaving exceeded those arriving by 9,054, the balance in the corresponding period of the previous year having been 2,831.

The passenger movement between the United Kingdom and the Continent of Europe or the Mediterranean Sea showed a balance inward of 78,351 persons, British and aliens,‡ in the fourth quarter of the year.

Thus the balance of the aggregate passenger movement in the quarter to and from all Countries was 67,692 inward.

COLONIAL AND FOREIGN CITIES.

The Registrar-General has been favoured with returns of vital statistics by the authorities of certain Colonial and Foreign Cities. From these a summary has been constructed for the 13 weeks ended 2nd January, 1915 (Table XV).

---

* The revised estimates of population in the middle of 1914 are as follows:—United Kingdom 46,089,249, England and Wales 36,960,684 (see page vii), Scotland 4,747,167 (as above), Ireland 4,381,398 (as above).

† The number of persons married during the quarter ended 30th June, 1914, was 191,520, the rate being 16·5 per 1000.

‡ The number of aliens included in this total is not available.

RETURNS OF NOTIFIED CASES OF INFECTIOUS DISEASE.

At the request of the Local Government Board, and of the London County Council, and on their responsibility with respect to accuracy, tables have been inserted, in continuation of those published in previous returns, showing the numbers of cases of infectious sickness notified, under Act of Parliament, to the Sanitary Authorities of certain of the largest towns in England and Wales, during the 13 weeks ended 2nd January, 1915 (*see* pages 21-26); and in the two following tables, these numbers have been reduced to rates per 1000 living in the several populations (*see* pages 27-32).

METEOROLOGY.

A Wet and Mild Quarter.

For the quarter as a whole the temperature was above the average, the greatest divergence being 1°·8 in England North-East, and the least 0°·3 in England South-West. The southern and south-western counties, which had a mean temperature of about 46°·5, were more than 1°·5 warmer than the midland and north-eastern counties. The only cold periods were the latter half of November and about a week after the 18th December. Owing to the heavy rains of November and December the quarter was very wet, especially in the southern counties, where the total rainfall was more than 5 in. in excess of the normal. The number of days with rain was also above the normal except in the western districts. Periods with clear sky were very few, and the duration of sunshine was below the normal in all the eastern and central parts of the country, just equal to it in the south and north-west, and slightly above it in the south-west only.

October.

A Dry and Dull Month.

The droughty condition which had prevailed with more or less persistency during the two preceding months continued until the 12th or 13th over the southern half of England and Wales, and little rain occurred further north. Over a large portion of the southern regions absolute drought had continued from the 18th or 19th of September, and the total number of days with drought exceeded 23 at a great number of stations. At Dursley, Malvern, and Rhyl it was 25 days and at Worcester Lodge, Forest of Dean, 26 days. The subsequent weather, although rather unsettled, did not become generally rainy until after the 20th, and it was not until the last week that the falls became at all heavy. On the 25th a few places recorded about an inch, and a similar quantity fell at Canterbury on the 29th. The total fall for the month was about 2 in. less than the average in the western half of the country, and about 0·7 in. less in the east. A few isolated thunderstorms occurred from time to time, but none of great severity was reported.

Although the weather was dry it was not at all bright, and the total duration of sunshine on the mainland was below the normal, the deficit ranging from 0·12 hour per day in the south-west to 0·87 hour per day in the east. Every week but the last—the wettest period—was dull for the time of year. The brightest district on the mainland was England South-West with a mean record of 3·16 hour per day, while the least sunny was the midland counties, with a daily mean of only 2·32 hour. At Scilly and the Channel Islands the mean daily duration was 4·13 hour, and exceeded the normal.

A remarkable feature of the month was the absence of stormy winds. Not one general gale was experienced, and there were very few on any part of the coast. A South-Easterly gale that prevailed on the 30th over the North Sea, however, caused the wreck of the Admiralty Hospital Ship "Rohilla" on Whitby Rocks, with the loss of 70 lives. The direction of the wind was as frequently from some Easterly point as from the West and South, while on many occasions it was from the Northward.

Temperature was seldom low for the time of year, and the mean for the month exceeded the normal by about 2°. The warmest days occurred during the first week, and the coldest nights were generally experienced late in the month. Frost was rare and slight, and over an extensive area the sheltered thermometer did not fall below 32°.

November.

A Wet Month: Cold in the Third Week.

The month considered generally was wet and rather rough. Gales, either partial or general, were frequent, and mostly from some point between South and West, while the temperature, after being high for the time of year until the 14th, fell decidedly, and was subsequently below the normal until towards the end of the period.

The rain was often heavy, and fell on about twenty days over the country generally. The wettest districts, in relation to the average, were England South-East, with 4·0 in., and England North-West, with 4·7 in., the former having an excess of 1·0 in., and the latter of 1·1 in. Locally the excess was much more marked; at Wilton, Salisbury, it equalled 4·0 in., at Stonyhurst 3·7 in., and at Ashburton 2·6 in. There were, on the other hand, a few places comparatively dry. At Cullompton there was a deficit of 0·6 in., at Berkhamsted 0·5 in., and at Scarborough 0·3 in. Snow was rarely experienced, but closely following the reduction of temperature on the 14th a considerable quantity fell in the north and east. At West Witton the depth was as much as 7 in. The droughty weather of the preceding months had caused the wells and streams to become very low, and some of the wells continued to fall during the first week of November. At Kings Somborne the lowest point was reached between the 10th and 14th, after which the water rose and fell a few inches. Between the 17th and 24th the general condition of the weather was dry, with little wind. Fogs, however, which in similar conditions in November are sometimes very prevalent, were neither widespread nor very persistent.

The *temperature* of the month as a whole was about 1° above the average in the north-eastern, eastern, and midland counties, 0°·5 above in the south-east, equal to it in the north-west, and 0°·4 below it in the south-west. The change from autumn mildness to winter cold after the 14th was very striking. In the south-east of England, for instance, the mean temperature for the former period was 52°·3, or 4°·3 above the normal, while for the week ending on the 21st the corresponding mean was 38°·6, and the difference from the normal −6°·6. A similar change was general in the other districts. The maximum readings of the day during the colder spell were less high than many of the night minima of the milder period. On several dates between the 14th and 21st the thermometer failed to exceed 36° or 37° except on the most sheltered parts of the south-west coast. At Northwich the maximum temperature on the 17th

was as low as 30°, the exceptional cold being due to the prevalence of fog. Frost occurred on one or more nights after the 14th in nearly all parts of the country, but as a rule the sheltered thermometer only descended to 27° or 28°. At various places inland, however, the minima on the 19th and 21st were much lower. At a number of stations the thermometer fell to 20° or 21°, and at Wellington, Shropshire, touched 15°.

The number of hours of bright sunshine exceeded the normal over the country as a whole. The largest excess was in the south-east of England where it amounted to a daily mean of 0·57 hour. The Midland Counties and England North-East, however, were exceptions, a slight deficiency being reported. In the south-east the mean daily duration was 2·62 hour, and in the east of England 2·26 hour. In the Midland Counties and England North-East the corresponding values were 1·66 and 1·67 hour.

December.

A month of rain, gales and floods. Previous Records exceeded.

The rough and rainy weather which characterized November became much accentuated during this month. Gales and strong winds occurred with great frequency, and precipitation occurred almost daily. Generally the latter came in the form of rain, but on the 28th there was a considerable fall of wet snow in the central, eastern, and south-eastern counties.

Over the country as a whole the total rainfall for the month was more than twice as much as the December average, while in the south, and locally elsewhere, the excess was quite abnormal. A very large area in the south received more than three times the average quantity, and at Hawarden Bridge, Cheshire, there was more than four times the average. At Kew observatory, the aggregate fall of 6·37 in. was the largest in December since the record began 59 years ago. At Greenwich observatory the total of 5·96 in. is larger than any December total for 100 years. The persistent downpours in the Thames Valley yielded more water than in any December for many years, and towards the end of the month serious inundations began. Falls exceeding an inch within 24 hours were too frequent and widespread to enumerate. On the 9th a considerable portion of the south had more than 2 in.; 2·1 in. at Haslemere and Heathfield, 2·2 in. at Warlingham, 2·3 in. at Emsworth, 2·4 in. at Aldershot and Midhurst, and 2·5 in. at Ventnor and Sandown. Another very heavy downpour occurred on the 17th, but was more marked over Wales and the north-west of England than elsewhere. Several stations at ordinary altitudes measured more than 1·5 in. and some in Snowdonia more than 4 in. Betweon the 18th and 25th an occasional day passed with little or no rain, but a considerable amount fell on the 26th, and large quantities on the 27th and 28th. On this last day falls of an inch and upward were more common than on any other day of the month. The rain was accompanied by a South-Westerly to Westerly gale of great violence in the south and south-east of England. At Shoeburyness the velocity of the gusts reached 80 miles per hour and at Dover 76 miles. During the evening, as the wind veered to the Westward, the rain gave place to wet snow, and the wind and snow combined caused considerable damage in the east and south-east.

Temperature was above the average until the 18th, and little frost was experienced, but subsequently until late in the month it was below the normal, and sharp frost occurred in nearly all parts of the country, especially between the 21st and the morning of the 25th; at Wellington (Shropshire), the minimum temperature on the 25th was as low as 13°. A heavy glazed frost occurred at West Witton on the 22nd and 23rd, and at Douglas, Isle of Man, on the 23rd and 24th. At the former place the frost caused several accidents, one of which was fatal. On the 24th, when the weather was very quiet, thick fog was developed in various parts of the metropolis and in many localities elsewhere. During the first two weeks maximum temperature readings of 55° or a little higher were recorded, but later they were seldom as high as 50° and sometimes below 40°. Both on the 23rd and 24th the thermometer remained below 32° throughout the day in some of the inland districts. For the month as a whole the temperature was above the average—about 2°·5 in England East and South-East.

Bright Sunshine was above the normal except in England East and South-East, but the divergence was nowhere large. The highest daily mean duration was 1·9 hour in England South-West, and the lowest 1·2 hour in England East and North-West.

Revised Estimates of Population.

The population of England and Wales as a whole has hitherto been estimated on the assumption that the rate of increase during 1901–11 has continued, but in view of the fall in the rate of natural increase since 1911 and an increase in the loss by migration a new estimate has been made for the middle of 1914 based upon the returns of births, deaths and migration.

The populations of parts of the country, such as counties, towns, &c., being estimated by the method described in the Annual Report for 1907, pages cxxxii–cxxxiv, and in that for 1910, pages xi and xii, are affected by the alteration in the estimate for the country as a whole. Revised estimates which have accordingly been prepared for these areas are shown in the tables in this return that relate to the year (Tables XVI–XXVI). The new populations have been employed in the calculation of all yearly rates, but for the sake of uniformity the old populations have been continued in use for quarterly rates and are still shown in the tables relating to the quarter (Tables I–XV).

Summary, 1914.

The Summary relating to the year 1914, giving the principal Tables published up to 1912 in the "Annual Summary" will be found on pages 36 to 63 of this publication, the Tables being numbered XVI to XXVI.

ENGLAND AND WALES.

According to the quarterly returns furnished by local registrars, 878,822 births and 516,778 deaths were registered in England and Wales in the year 1914. The natural increase of population, by

excess of births over deaths, was therefore 362,044, the average annual increase in the preceding five years having been 385,153. The number of persons married during the year was 588,174.

The marriage-rate in England and Wales in 1914 was 15·9 persons married per 1,000 of the population. Allowing for revised estimates of population for the years 1911-1914, the marriage-rate in 1914 showed an increase of 0·6 per 1,000 upon the average in the ten years 1904–1913.

The birth-rate in 1914 was 23·8 per 1,000 of the population, which is 0·3 per 1,000 below the rate in 1913, and lower than the rate in any other year on record, due allowance being made for revised estimates of population. Compared with the revised average in the ten years 1904–1913, the birth-rate in 1914 showed a decrease of 2·1 per 1,000.

The death-rate in 1914 was 14·0 per 1,000, which was 0·2 per 1,000 above the revised rate in 1913; compared with the revised average rate in the ten years 1904–1913, the death-rate in 1914 showed a decrease of 0·7 per 1,000.

CHANGES IN THE BOUNDARIES OF ADMINISTRATIVE AREAS AND POOR LAW AREAS.

Tables will be found on pages 64–77 showing particulars as to changes in the boundaries of Administrative Areas and Poor Law Areas from 1st July, 1912, to 31st December, 1914. These tables give not only the acreage and total enumerated population of each of the transferred areas, but also the population by sex and age in the case of changes affecting administrative areas. It is proposed to publish similar statements of further changes at six-monthly intervals.

Particulars of the changes that have occurred since the Census of 1911, but before those now given, will be found in the form of notes in Volumes I and II of the Census Report, 1911, and the sex- and age-populations of the altered areas in Table 8B of Volume VII of the same report.

QUARTERLY TABLES.

* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex- and age- constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix.

Table IV.—Commercial Statistics and Pauperism, 1913-1914.

Quarter ended	Average Prices. 2½*l.* per Cent. * The Price of Consols and the Rate of Discount are furnished by the Chief Cashier of the Bank of England. † As published by the Board of Agriculture.
‡ Furnished by the Board of Agriculture. § Furnished by the Mining Statistics Branch of the Home Office. The prices relate to Sunderland coal only.
¶ No quotations during the quarter.
‖ This amount relates to the month of July only, no official quotation having been obtainable since the Stock Exchange was closed on 31st July. The Stock Exchange remained closed during the quarter ended 31st December, 1914, and no official prices were therefore recorded, but the minimum price at which transactions in this security were allowed by the Stock Exchange Committee was £68 10*s.* 0*d.*

TABLE V.—**England and Wales and Registration Counties.**—ESTIMATED POPULATION: MARRIAGES registered in the Quarter ended 30th September, 1914; BIRTHS and DEATHS registered in the Quarter ended 31st December, 1914.

NOTE.—The Registration or Union Counties consist of groups of Registration Districts which are generally co-extensive with Poor Law Unions of the same names. The differences between Registration Counties and Administrative Counties are shown in Table 7 of Vol. II. of the Abstracts of the Census Returns, 1911 (Cd. 6259). The numbers of marriages, births, and deaths, are the numbers actually registered in each case.

REGISTRATION COUNTIES.	ESTIMATED POPULATION in the middle of 1914. (Old Estimates.)*	MARRIAGES in Quarter ended 30th Sept., 1914.	BIRTHS in Quarter ended 31st Dec., 1914.	DEATHS in Quarter ended 31st Dec., 1914.	The DEATHS registered include													REGISTRATION COUNTIES.

TABLE VII.—**97 Great Towns; Greater London; 4 Scottish or Irish Towns.—Population; Births, Deaths, and Meteorology** in the 13 weeks ended **2nd January, 1915.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The deaths in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

* The values for Mean Temperature and Rainfall relate to the calendar quarter. [a] Phœnix Park. [b] Fitzwilliam Square † As before the extension on 1st October, 1914.

‡ Including 47 deaths due to the German bombardment on 16th December, 1914. Two were those of infants under one year of age, and one that of a person aged 65 years or upwards. Twenty-one of the deaths occurred in institutions.

§ For the calendar quarter. Deaths of non-residents domiciled in Scotland deducted and those of residents registered elsewhere in Scotland added. The deaths from diphtheria include those from croup. See Table XVIII. for revised estimates of population.

‖ Excluding deaths of persons admitted into public institutions from without the boundaries of Dublin and Belfast respectively.

TABLE VIII.—**97 Great Towns; Greater London; 4 Scottish** or **Irish Towns.—Birth-rate, Death-rate,** and **Analysis** of **Mortality** in the **13 Weeks ended 2nd January, 1915.**

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The birth-rate is based upon births actually registered in the several towns. The death-rate in London has been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County. (See also Table XIV.) The death-rates in the other towns have been corrected, as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying public institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

† Uncorrected for deaths of non-residents.

‡ Including croup.

TABLE IX.—**One hundred and forty-five Smaller Towns.—Population; Births and Deaths** in the QUARTER ended 31st December, 1914.

NOTE.—The 145 Smaller Towns are those with populations of 20,000 but not exceeding 50,000 at the Census of 1911. The births here shown are those actually registered in the several towns. The deaths have been corrected as far as possible, (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	ESTIMATED POPULATION IN THE MIDDLE OF 1914. (Old Estimates.)*	BIRTHS.	DEATHS.	The DEATHS registered in the Quarter include													TOWNS.
				Deaths of		DEATHS from

* The Standardized Death-rates represent the Crude Death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex- and age-constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, p. xxix. Owing to the difficulty of distributing to their proper areas deaths occurring in public institutions the death-rate of the rural area is somewhat overstated.

NOTE.—The 97 Great Towns are those with populations exceeding 50,000 persons at the Census of 1911. The births shown in this table are those registered in the several towns without correction, except in the case of London. The births in London have been corrected by the transference of those occurring in the principal institutions receiving maternity cases. The deaths in London have been corrected as far as possible (1) by excluding deaths of all non-residents, and (2) by including the deaths of London residents occurring in the Metropolitan Outer Ring or in Metropolitan Public Institutions situated outside the County (See Table XXI.) The deaths in the other towns have been corrected, as far as possible (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying Public Institutions. With regard to the Outer Ring and its constituent areas, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made.

TOWNS.	Estimated Population in the middle of 1914. (Revised Estimates.)*	Births.	Deaths.	The Deaths registered include												Mean Temperature (Degrees Fahr.). †	Rainfall (Inches). †	TOWNS.

* The values for Mean Temperature and Rainfall relate to the calendar year.
† As before the extension on 1st October, 1914. ‡ As extended on 9th November, 1913.
§ Including 47 deaths due to the German bombardment on 16th December, 1914. For details of these deaths see Table VII.
¶ The figures for Edinburgh and Glasgow relate to the calendar year. The deaths are corrected throughout by deduction of deaths of non-residents domiciled in Scotland, and by addition of deaths of residents registered elsewhere in Scotland. The deaths in Dublin and Belfast

in the several towns. The deaths have been corrected as far as possible (1) by the exclusion of all deaths of non-residents, and (2) by the inclusion of deaths of residents in certain outlying institutions. With regard to towns in the Outer Ring, however, correction is more complete, a distribution of all transferable deaths occurring in any part of Greater London having been made. In consequence of extension in 1913, Exeter is transferred to the group of Great Towns and St. Albans added to that of Smaller Towns.

* For the purpose of this table the Births registered in London have been corrected by distributing those which occurred in the principal institutions receiving maternity cases to the boroughs in which the mothers resided. In 1370 cases the residence was outside the County of London and these cases have been excluded. On the other hand 55 births that occurred outside the County have been included. With regard to the Deaths of London residents, all transferable deaths (*i.e.*, those of persons who, having a fixed or usual residence in England and Wales, die in a district other than that in which they resided) occurring in Greater London and in certain Metropolitan Institutions outside Greater London have been distributed to the Metropolitan Borough to which the deceased belonged. Of the deaths registered in London the previous residence was outside the county in 3433 cases, while on the other hand the deaths of 3082 London residents occurred in the Outer Ring or in Metropolitan Institutions outside Greater London.

† See Remarks, page vii.

TABLE XXII.—**LONDON** and the **METROPOLITAN BOROUGHS.**—**Birth-rates** and **Death-rates** of **Persons** belonging to **London** and the **Metropolitan Boroughs** during the **52 Weeks** ended **2nd January, 1915.**

* The Standardized death-rates represent the Crude death-rates multiplied by the respective Standardizing Factors in order to make correction for differences of sex- and age-constitution of the several populations in 1911 as compared with that of England and Wales in 1901. A description of the method of constructing these Factors is to be found in the Annual Report for 1911, page xxix.

* The figures in this Table, excepting those for London, which are derived from Table XXIV., are compiled and furnished to the Registrar-General by the Medical Officer of the Local Government Board.

† *See* Remarks page vii.

‡ The figures for Southsea District of Portsmouth are—population (1911), 25,380; enteric fever, 14; typhus, nil; continued fever, nil; small-pox, nil; scarlet fever, 43; diphtheria (including membranous croup), 81; erysipelas, 8; and puerperal fever, nil.

§ The number of cases notified for these towns include those for the areas as extended from 9th November, 1914. The estimated population of the extended areas in the middle of 1914 are:—Bournemouth 84,037, Plymouth 211,042.

‖ Cases from 4th January, 1914, to 8th November, 1914, only.

¶ Subsequently found not to be cases of small-pox.

TABLE XXIII. (*continued*).—NUMBER of CASES of INFECTIOUS DISEASE NOTIFIED in certain LARGE TOWNS of ENGLAND and WALES during the 52 Weeks ended 2nd January, 1915.*

* The hours of observation are 9 a.m. and 9 p.m. local time.

† The averages used are obtained from observations extending over 65 years for Rain, 70 years for Temperature, and 18 years for Sunshine.

Pressure is expressed in millibars (1000 mb. = 29·531 mercury-inches). *Wind Force.*—Beaufort Scale (0–12) is used. The Summary is obtained from the records of a cup anemograph having 5 in. cups and 15 in. arms. The factor used is 3. Winds above 37 miles per hour are reckoned as gales and winds between 21 and 37 miles per hour as moderate or strong winds.
